We stand for the Continuation of the United States as having been divinely inspired.

Why Are We Afraid Of Contracts?

Sometimes it seems almost as though America is studiously doing its best to lose friends and alienate people. For a country that is innately frank, open, friendly and trusting, we are doing a remarkable job of convincing the world that we are just the opposite.

The latest example of our stonewalling policy is the State Department's refusal to permit Russia's chess champion, David Bronstein, to come to the United States to compete in a chess tournament. He can't come because the tournament is being held in Dallas, Tex., and Dallas is among the areas of the United States in which Russians are forbidden to travel. So Bronstein's application was turned down and the State Department succeeded in handing the Soviets another effective bullet to shoot in their propaganda weapons.

This is a country that prides itself on its sportsmanship, that boasts of its freedoms, that believes that in any contact between peoples, the American way of life is bound to prove itself superior. This is a country capable of sending, as the people of San Francisco have just done, a 15-year-old "children's ambassador" to the Middle East, loaded with 10,000 toys donated by San Franciscans to the underprivileged children of that area.

The State Department's silliness does not accurately reflect the feelings of the people of America. Nor have the people of America been told to their satisfaction what the State Department is afraid of, or so stubbornly opposing people-to-people contacts.

How can we lose in general exchange of ideas and cultures with the Soviets?

We suffer so badly by comparison with Russia in this field. The Soviet Embassy estimates that 2,500 Americans received visas for non-official visits to Russia last year, and that the figure will be much greater this year. Dr. G. O. Tanner, who recently returned from Russia, reports that Russia has not turned down a single visa application in the past year. And how many non-official visits were approved for Russians to visit America? None last year and ninety-five this year.

The government, after a great deal of pressure, did finally end the requirement that all Russian visitors be fingerprinted—a rule that made possible some effective propaganda picturing the U.S. as a police state. But as the chess tournament affair shows, we still retain the nonsensical restriction on travel of Russians in approximately a third of the area of the United States. This restriction, without reference to strategic areas or other security requirements, would, for example, prevent any Russian from traveling through a great deal of our scenic Mountain West.

Moreover, the State Department does its best to discourage travel of Americans to Russia. A notable example was the World Youth and Student Festival in Moscow last summer. The State Department's attitude meant that instead of a large delegation of capable, fine American youngsters, we sent a group of largely rebellious, non-representative Americans who drew world attention to the government's suspicious nature.

Meanwhile, our military people busy themselves making statements that of General Thomas D. White yesterday, that American air power has the Soviet Union "screed in from every direction." We rattle the saber. We reflect fear and suspicion. We hold the Russian people at arm's length. Is it any wonder that their leaders are able to convince them so thoroughly that we are to be feared?

What are the alternatives? As Dr. Tanner has expressed it, our present course is taking us straight toward war. And as he has suggested, the one hopeful way to get on a different course is to change our attitudes toward people-to-people contacts.

We cannot be waged until the people of a nation are prepared mentally and psychologically for it. Suspicion, fear, lack of understanding—these are the attitudes in which that dreadful preparation can be made. Closer contact, greater knowledge, more understanding—these are the building blocks.

The State Department should catch up with the feeling and thinking of the people of this nation.

Lights at Christmas Time

Now it's official! The Christmas season is here. When the lights popped on along Main and State Streets business areas last night, as well as in Sugar House, Holladay, other suburban areas, that was it. The annual holiday extravaganza takes over now and holds sway for the next 25 days.

With the most expensive and brilliant illumination effort in Salt Lake City since downtown was first devoted for this occasion, last evening came Santa Claus and the annual Christmas parade. And how the children loved it—millions of them, so it must have seemed to the old gentleman as he passed before their bedazzled eyes.

The traditional clown, odd, stirring music, the old and also of the little tots looking on in pop-eyed wonderment, the beautiful floats, the Story Princess, and all these other fairyland characters—well, that's the Christmas parade in Salt Lake City.

Downtown was dressed for it, too. Did you ever look down upon Main Street or

State Street from Capitol Hill at night during the Christmas season? The picture to see and to remember. Millions of jewels sparkling and flashing under stars which seem to yield to the competition—that is a feeble description of this stirring scene.

Now is the business lighting scheme, continued to the business areas. Once again the residential areas will join in the cheer, but let them compete for the honor of displaying the most artistically decorated residence. The Deseret News and the Intermountain Electric Assn., co-sponsors, have arranged for some excellent prizes. With entire neighborhoods, avenues and districts vying for the honor, Salt Lake should light up as brilliantly as any city in the country.

There are just enough days before Christmas to get out that string of globes for outside trees and around the border of the house, with Dancer, Prancer and Vixen on the rooftop. That helps make Christmas more exciting and our town most beautiful.

Too Much Water

Our friends from southern California may be just a little embarrassed, in view of their long opposition to the Upper Colorado River Storage Project, with a problem now facing the Colorado River Commission. The problem is what to do with surplus water. There's too much in Lake Mead behind Hoover Dam and no immediate market for more cheap power to be obtained by letting water through the dam.

In the past six months, allotment of power to Hoover Dam customers has been nearly doubled, with still more cheap power available. But despite this high production, the reservoir stays high. In November, a month when it usually drops sharply, the reservoir is upped less than a foot. The lake

has risen 35 feet in the past year. The Bureau of Reclamation must get rid of the good deal of water to make room for the big spring runoff starting in April.

All this represents more than a problem to the Lower Basin. It also represents a challenge to the Upper Basin to get its mainstem dams built as quickly as possible. This year has apparently been the beginning of the long-awaited wet cycle and it will be a shame to waste water downstream any longer than is absolutely necessary.

Filling the reservoirs behind Glen Canyon and Flaming Gorge dams will be a long, slow process at best. Every effort should be made to store water before the wet cycle runs its course.

Pup Poisoning Is Low Business

It would be difficult to imagine any form of malicious devilry more wicked than poisoning dogs. Vandals or hoodlums, or both, have raided pigeon lofts, fished hub caps and broken windows in schools, churches and automobiles hereabouts in recent weeks, all of which depicts a low degree of human behavior, but dog poisoning is the lowest yet.

Police officers this week were faced with the investigation of another outbreak of dog poisonings, a little more than a year after a similar flareup on the west side. Eight dogs in all have been destroyed recently by means of poison, all in the neighborhood of 20th Street and 25th East.

Dog poisoning requires a heavy contempt for dog sportsmanship as well as lack of human sensibility, a dishonest at-

titude toward the property rights of others, and a stupid disregard of the possibility that the poison may kill a tiny child instead of a dog. It's a form of malicious destruction far out of proportion to the returns, save as any other felony.

Owners, of course, should obey the law and keep their dogs penned or restrained on the premises. Likewise, anyone who has a gripe against a dog should contact its owner and make known his complaint. But the heartless rogue who kills dogs indiscriminately in order to destroy one particular animal, or just because he does not like dogs generally, is of a low form of mentality.

Poisoning is a cruel and vicious way to take life. It has no place in a civilized community.

U.S. Was Urged To Ban Einstein?

25 Years Ago
From the Deseret News File
NOV. 26, 1932.—The Women's Patriotic Corporation demanded that the State Department demand the free admission to Albert Einstein, German scientist, who was to come to this country to lecture on the charge that Einstein was a Communist.

50 Years Ago
NOV. 26, 1907.—Lombro, called the greatest criminologist

of the world, was lauded by Bertillon, the discoverer of the so-called system of Bertillon measurements. The former had read a man's palm and "discovered" by the lines that he was a criminal, when the fact turned out to be that he was an honest workman. His hands lined by the nature of his toil. The arrest, followed by the "discovery," and illustrated with photographs, occupied an entire page.

75 Years Ago
NOV. 26.—Today was Thanksgiving Day and so no news was issued.

100 Years Ago
NOV. 26, 1857.—The memorial of Professor William Brewster, of the Smithsonian Institution, and 42 other men of Connecticut to President James Buchanan was printed in full. It objected "with grief, if not with astonishment," the sending of federal troops into Kansas.

Produce Flock To 'Hot Spots' In Indian Country

COKE TILLEY looked hopefully at the old Navajo couple standing outside the hogan, and made a derrick with his hands. His sign-language derrick looked like a wigwag at first, but finally he managed to get the idea across.

An oil scout for Standard of Texas, working out of Albuquerque, Coke was in the desolate but beautiful Four Corners area where New Mexico, Colorado, Utah and Arizona join—the only place in the United States where four states come together and, at the moment, the hottest spot in the country for oil hunters.

He was there to see if a pump had been installed on Stok's second producing well in the area—Haynes & V.T. Federal No. 1 Sapp.

In this land where buttes and canyons could hide an army—or suddenly open up to reveal a hundred-mile vista—he was having a tough time finding the derrick.

Coke finally found V.T. No. 1 all right, but not with the help of the Navajos. He had to get back on the highway and drive several miles to the Exporto Trading Post where the all-knowing trader pointed him in the right direction.

The Oil Hunt At Four Corners

Utah Colorado Arizona New Mexico

FARMINGTON

San Juan Territory Becomes Boom-Country Due To Discovery Of Oil, Gas And Uranium

come out of the hole at night to maintain secrecy.

Thirty miles northwest of Calico, a crew had at work installing the pump. But, in the southeast Utah, Western Operations, Inc., is sending geophysical crews over its leased acreage. This includes a half interest in 42,000 acres in the booming Paradox Basin, and another 2,940 acres held outright and adjacent to Aneth Field.

Oil shows have been found in the Four Corners area since the turn of the century but because of its remoteness and the lack of transportation it has been difficult to develop the area.

Not until a year ago did oil producers start developing the region in earnest. Even now the wells in New Mexico are held to 10 per cent production because of lack of transportation. What oil is produced is trucked to Albuquerque.

This is being remedied now: Several pipelines have been proposed to run from the Four Corners to the Pacific Coast. (Construction of a

Rebirth Of A Utah Dinosaur

By E. G. UNTERMYER
Director, Utah Field House of Natural History
(from the Deseret News)

A LTRIGHT dinosaurs have been extinct for eons of time, every now and then one crops up and makes headlines. The recent supposed to achieve publicity is one Diplodocus Carnegie placity. This is not a reincarnation in the "Bridges Murphy" manner but the restoration of a dinosaur skeleton in concrete. Quite a bit of history precedes the creation of this monster erected on the lawn of the Utah Field House of Natural History at Vernal.

Around the turn of the century, Andrew Carnegie, the Pittsburgh steel magnate, famous for his philanthropy in libraries, museums, and so forth, extended his activities into the field of dinosaur research. Dinosaur fossils, especially complete skeletons, were none too abundant but the museums of the world prized them highly for their exhibit and educational programs. At this point Mr. Carnegie moved to alleviate the "shortage" of dinosaur skeletons by commissioning Dr. Arthur S. Cope, shall it be now director of the Santa Barbara, Calif., Museum of Natural History, to find more. Mr. Carnegie had 16 replicas created, in plaster, which he presented as gifts to European, South American and Mexican museums. The first of these, at the suggestion of King Edward VII of England, was the British Museum on May 12, 1905. When the other nine replicas were completed the models were stored in the basement of Carnegie Museum where they collected Pittsburgh spot for more than 40 years.

United States and Canada, the present skeleton is the only authentic replica showing the "internal structure" to be cast in concrete so far as we know. All other skeletal representations have been exhibited indoors and were cast in plaster.

Diplodocus is a wondrous addition to the museum's exhibits. Standing on the lawn adjacent to Highway No. 40 we trust it will cause no traffic jams or collisions.

Dinosaur, first put in an appearance in Early Triassic time, about 200 million years ago. These cold-blooded reptiles were the most successful form of land life that Nature ever devised, and were the ruling class over a period of 140 million years. No other form of land animal can ever begin to challenge their lengthy reign. Although man is only a "recent" arrival, he now dominates the stage of time and, being the only animal capable of controlling his environment, promises to be around for quite a while—unless he shortens his natural span by blowing himself to kingdom come.

CHANGING climates at the close of Cretaceous times, 65 million years ago, resulted in the worldwide extinction of the dinosaurs, largely because of their inability to adapt themselves to changing conditions and also due to their overspecialization and racial old age. At this stage in the geological history of the earth, widespread mountain building produced a colder, drier climate which was wholly hostile to the needs of animals who had long enjoyed tropical to sub-tropical temperatures. Their "time" had come, and the smaller, warm-blooded mammals took over the earth.

We only hope that Diplodocus will be able to survive our winter temperatures, for he will make quite a pathetic figure, at times, when a blanket of snow covers his back and icicles dangle from his chin.

THE DINOSAUR

THE DINOSAUR as it appears today stands in front of the Utah Field House of Natural History.

At the moment, the Sotex and Calco geologists sitting on two wildcats now drilling in the Four Corners area are cursing their fingers in hopes that their luck will be as good as Dick Stamp's. (FROM "STANDARD OILS" MAGAZINE)

well-means are doing very "oil," according to R. N. Usher, president of the Citizens State Bank of Cortez. "Our total deposits increased more than \$2 million last year."

"The town is growing, by leaps and bounds. More than 500 trailers have come in here and housing is tight. The last census showed 2,069 people here but more keep coming every day."

"This small town has 10 places for rent at its small airport. Rental cars are at a premium. Frontier Airlines has 12 flights daily in and out of this one-time quiet town—"center of the black-eyed pea industry of the U.S."

HOPES FOR SUCCESS in the Four Corners area gained momentum when the Haynes and V.T. Federal No. 1 Sapp well came in several weeks ago.

Dick Stamp, who received his master's degree in geology last June from Iowa State College, played a key role in that discovery. He joined Standard of Texas Exploration Department July 2 and was assigned to the Northwestern Division headquarters at Albuquerque, headed by District Geologist Roy Doherty.

Dick was temporarily assigned to "sit on" the Haynes and V.T. hole. He was there when the well was drilled into the top of the Point Lookout sandstone.

FROM EXAMINATION of the samples, he found evidence of oil shows and suggested testing. Normally such areas are expected somewhat deeper in this section, but tests were made anyway. As a result of Dick's timely and careful examination, a new productive zone was discovered.
